

LiquidityWise

Product overview - an independent, educational advisor for Uniswap v3 and v4 liquidity providers

liquiditywise.com | github.com/Saylool/liquiditywise (MIT) | x.com/LiquidityWise

The problem

Providing liquidity on Uniswap means choosing a price range. Too narrow and a position stops earning the moment the price moves; too wide and it earns very little. Most guides hand over a number the reader cannot check, mostly in English, and a language model asked to explain it can invent one.

What LiquidityWise does

- Works out a suggested price range from how far a pair has actually moved, for v3 and v4 pools on Ethereum, Base, Arbitrum, Unichain, OP Mainnet and Polygon.
- Shows where the best-earning liquidity sits, measured on chain: the fees each position earned since it last changed, over its value now. The page says what that figure leaves out.
- Lists v4 hooks with the permissions each one has, and warns where a hook can alter a swap.
- Shows the positions of any public address, with optional Telegram alerts when one leaves its range.
- Interface and explanations in ten languages: English, Turkish, German, Spanish, Arabic, Hindi, Chinese (simplified and traditional), Russian, Portuguese.

Why it can be trusted

- Every figure is computed by code from the pool's own data and cross-checked. The language model only explains it and is never allowed to state a number.
- It never asks a wallet for a signature or a transaction, and keeps nothing about who reads the site.
- It is monitored (data sources probed hourly, outages reported) and covered by over 4,000 automated tests. The code is open under the MIT licence.

Use so far (first week measured, 25 Sep - 1 Oct 2026)

- 981 pages opened by people (bots excluded); 32 different pools opened; 12 searches.
- Readers in all ten languages; the largest were English (455), Chinese (377) and Turkish (42).
- Model cost for the week: about USD 1. Telegram alerts are new: 0 chats following an address so far.
- No TVL, volume or revenue: it is a read-only educational tool.

What the grant would pay for (six months)

- Months 1-2: positions on Arbitrum (no data source answers today) and v4 positions.
- Months 3-4: native-speaker review of the ten languages and a public methodology page.
- Months 5-6: promote the Telegram alerts where the largest readers already are; publish the weekly usage counts.

Requested: USD 25,400 = engineering 390 h x USD 50 (19,500) + language review (3,000, estimate) + independent method review (2,000, estimate) + running costs 6 x USD 150 (900).
